

Assignment

Objective:

Create a Django project with a REST API endpoint that processes a resume to extract the candidate's first name, email ID, and mobile number.

Project Requirements:

1. Project Setup:

- Set up a new Django project named `ResumeProcessor`.
- Create an app within the project called `resume`.

2. Database Configuration:

- Use PostgreSQL as the database for development purposes.

3. Models:

- Define a model `Candidate` with the following fields:
 - `first\_name`: CharField
 - `email`: EmailField
 - `mobile\_number`: CharField

4. Views and Serializers:

- Use Django REST Framework to create an API endpoint.
- Implement a view to handle resume extraction.
- Create a serializer for the `Candidate` model to facilitate JSON responses.

5. API Endpoint:

- Create an API endpoint `/api/extract\_resume/`.
- This endpoint should accept a POST request with a resume file (PDF or Word document).
- Extract the candidate's first name, email ID, and mobile number from the resume.

6. Business Logic:

Implement a function or service to parse the resume and extract relevant information

7. Response Format:

- The API should return a JSON response containing the candidate's first name, email ID, and mobile number in the following format:

```
{  
  "first_name": "John",  
  "email": "john.doe@example.com",  
  "mobile_number": "123-456-7890"  
}
```

8. Documentation:

- Add a README file with instructions on how to set up the project locally and test the API endpoint.

9.Submission Requirements:

Video Presentation: Submit a video explaining the project setup, implementation details, and demonstrating the working application. The video should clearly show how each part of the app functions.

GitLab Repository: Provide the project code in a GitLab repository. Ensure that all necessary files and documentation are included for us to test the project locally.

Submission: Finally, send the video link (use any video platform or YouTube any video platform) and the GitLab/GitHub repository link via the Internshala chat box.

Notes:

Notes:

You can use AI tools to enhance functionality or improve efficiency. We want to see your ability to use AI smartly and effectively, though it is not mandatory.

Feel free to leverage existing GitHub projects for reference. This will demonstrate how effectively you can utilize available resources.

Deadline:

Submit the assignment by 13th January 2025, no later than 11 a.m. However, please don't wait until the last date—try to submit the assignment as soon as possible. Once we review and like your assignment, you will proceed to the final round, which is a one-on-one interview. It is important to submit the assignment promptly.
